### Report Overview

A Molten Salt Reactor System (MSR) is a type of advanced nuclear reactor that utilizes a liquid fuel, typically a mixture of molten salts, instead of the solid fuel rods commonly found in traditional nuclear reactors. This innovative design offers several advantages, such as improved safety features, higher operational temperatures, and the potential for more efficient fuel utilization. The MSR operates by circulating a molten salt fuel mixture, which contains fissile material, through a core where it undergoes fission reactions, releasing heat. This heat is then transferred to a secondary coolant, which is used to generate steam and drive turbines for electricity production. The MSR's liquid fuel allows for continuous refueling and online reprocessing, which can enhance the reactor's operational flexibility and reduce the volume of nuclear waste. Additionally, MSRs can be designed to operate at lower pressures compared to conventional reactors, potentially reducing the risk of accidents.
