### Report Overview

A Motor Starting PTC Thermistor is a type of temperature-sensitive electronic component designed to protect and control the starting process of electric motors. It functions by exhibiting a positive temperature coefficient (PTC), which means its resistance increases with temperature. In the context of motor starting, this thermistor is typically used in conjunction with a motor's starting circuit to limit the inrush current during the initial phase of motor operation. As the motor starts and its temperature rises, the PTC thermistor's resistance increases, thereby reducing the current flow and preventing potential damage due to excessive current. This component is crucial for maintaining the longevity and efficiency of electric motors, especially in applications where high starting torque and protection against electrical surges are necessary.

This report provides a deep insight into the global Motor Starting PTC Thermistor market covering all its essential aspects.
