Abstracts

Multi-channel electric optical delay line is a device used to adjust and delay the transmission time of optical signals. It usually consists of multiple fiber optic channels, each of which can independently adjust the delay time of the optical signal. Precise delay control of optical signals can be achieved by changing the fiber length of each channel or introducing optical delay elements. Multi-channel electric optical delay lines are mainly used in fields such as optical experiments, optical communications and optical networks to meet the optical signal delay needs of different application scenarios. It can be used in applications such as optical signal processing, optical interference, optical imaging, optical measurement, etc. By adjusting the delay time of the optical signal, functions such as phase calibration, time alignment, and signal synchronization can be achieved. The multi-channel electric optical delay line has the following characteristics: 1. Multi-channel independent control: Each channel can independently adjust the delay time of the optical signal, and can process multiple optical signals at the same time. 2. High-precision delay control: Tiny delay adjustments can be achieved, usually at the nanosecond or picosecond level, to meet the needs of high-precision optical signal processing. 3. Wide delay range: Can provide a large delay range, usually from a few nanoseconds to a few milliseconds, or even longer. 4. Fast response and stability: It has fast response time and good stability, and can adjust and maintain the delay time of the optical signal in real time.

The global Multi Channel Motorized Optical Delay Line market size was estimated at USD 185.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
