Report Overview

A Multi-Jet Water Flow Meter is a sophisticated device designed to measure the flow rate of water in various applications, such as industrial processes, water treatment plants, and residential plumbing systems. This meter operates on the principle of multi-jet technology, which involves the use of multiple orifices or nozzles to create a series of jets that interact with the flowing water. The meter calculates the flow rate by measuring the pressure drop across these jets, which is directly proportional to the velocity of the water flow. The multi-jet design allows for a wide range of flow rates to be accurately measured, making it a versatile solution for different water flow conditions. The meter is typically composed of a body that houses the jet assembly, a pressure sensing mechanism, and an electronic interface that processes the data and provides a digital readout of the flow rate. This technology is known for its high accuracy, low pressure drop, and resistance to wear, making it a reliable choice for continuous flow measurement in both clean and dirty water applications.
