Report Overview

A Multi-Junction Solar Cell, also known as a Tandem Solar Cell, is a type of photovoltaic cell that consists of multiple layers of different semiconductor materials stacked together to absorb and convert a broader range of the solar spectrum into electricity. Each layer, or junction, is designed to capture a specific range of wavelengths, thereby increasing the overall efficiency of the solar cell. This advanced technology is particularly beneficial in high-efficiency applications, such as space satellites and concentrator photovoltaic systems, where maximizing energy conversion is crucial. The multi-junction design allows for the optimization of each layer to perform at its best within the solar spectrum, leading to higher power output and improved performance compared to traditional single-junction solar cells.
