### Report Overview

A Multiband Limiter is a sophisticated audio processing tool designed to control and balance the dynamic range of audio signals across multiple frequency bands. It operates by dividing the input signal into distinct frequency bands, typically using a series of band-pass filters. Each band is then individually processed by a limiter, which prevents the amplitude of the signal from exceeding a predefined threshold. This targeted approach allows for more precise control over the dynamics of different frequency components, leading to a cleaner, more polished sound. The Multiband Limiter is particularly useful in applications where maintaining clarity and reducing distortion in complex audio mixes is crucial, such as in professional audio production, broadcasting, and live sound reinforcement. By limiting each band separately, it can help to preserve the punch and clarity of lower frequencies while preventing harshness and distortion in higher frequencies, ultimately resulting in a more balanced and controlled audio output.
