Report Overview

A Multikinase Inhibitor is a type of pharmaceutical compound designed to target and inhibit the activity of multiple protein kinases within the human body. Protein kinases are enzymes that play a crucial role in various cellular processes, including cell growth, division, and survival. By inhibiting the activity of multiple kinases, these inhibitors can potentially disrupt multiple signaling pathways involved in diseases such as cancer. This approach can be particularly useful in treating cancers that are driven by multiple genetic mutations or in cases where a single kinase inhibitor may not be effective due to resistance or compensatory mechanisms. Multikinase inhibitors are often used in oncology to treat various types of cancer, and their development is an active area of research in the pharmaceutical industry.
