Report Overview

Multileaf Collimators (MLCs) for Radiation Therapy are advanced medical devices used in the field of oncology to deliver precise and targeted radiation doses to cancerous tumors. These devices are integral components of linear accelerators, which are machines that generate high-energy radiation for therapeutic purposes. MLCs consist of multiple thin, adjustable leaves made of high-density materials, which can be programmed to move in and out of the radiation beam's path. This movement allows for the shaping of the radiation field to conform precisely to the three-dimensional structure of the tumor, thereby maximizing the dose delivered to the cancerous cells while minimizing exposure to surrounding healthy tissues. The primary purpose of MLCs is to enhance the accuracy and effectiveness of radiation therapy, improving treatment outcomes and reducing side effects for patients undergoing cancer treatment.
