### Report Overview

Myoelectric prosthetic hands are advanced, state-of-the-art upper limb prosthetic devices designed to restore the functionality and appearance of an amputated or congenitally absent hand. These hands are powered by electrical signals generated by the user's muscles, which are detected and translated into mechanical movements by the prosthetic. They typically consist of a socket that fits over the residual limb, a control system that processes the myoelectric signals, and a series of motors and joints that enable the hand to move and grasp objects. Myoelectric prosthetic hands offer a high degree of dexterity and customization, allowing users to perform a wide range of tasks with greater independence and ease. These devices are often equipped with advanced features such as grip strength adjustment, multiple grip patterns, and even the ability to simulate the sensation of touch, making them a preferred choice for individuals seeking a more natural and intuitive prosthetic experience.
