### Report Overview

Myopia control lenses, specifically defocus lenses, are specialized optical lenses designed to slow the progression of myopia (nearsightedness) in children and adolescents by incorporating peripheral defocus technology. These lenses work by manipulating light focus on the retina, reducing the stimulus for axial elongation of the eye, which is a primary cause of myopia progression. Unlike traditional single-vision lenses, defocus lenses feature multiple optical zones that ensure central vision clarity while creating controlled peripheral defocus to inhibit excessive eye growth. The market for these lenses has grown significantly due to rising global myopia prevalence, increasing parental awareness of myopia management, and advancements in lens technology. Key players in the industry include Essilor, HOYA, Zeiss, and CooperVision, which offer proprietary designs such as D.I.M.S. (Defocus Incorporated Multiple Segments) and MiyoSmart. The Asia-Pacific region dominates demand, driven by high myopia rates in countries like China and Singapore, while North America and Europe are experiencing rapid adoption due to expanding clinical evidence supporting their efficacy. Challenges include higher costs compared to conventional lenses and the need for professional fitting, but growing insurance coverage and optometrist recommendations are expected to further drive market growth. The competitive landscape is characterized by innovation in lens materials, designs, and digital integration for personalized myopia management solutions.
