Report Overview

NaI(Tl) Scintillation Crystal, also known as Sodium Iodide Thallium-activated Scintillation Crystal, is a type of inorganic scintillator material used in various applications such as radiation detection, medical imaging, and scientific research. This crystal is composed of sodium iodide (NaI) as the primary component, with a small amount of thallium (Tl) added as an activator to enhance its scintillation properties. The crystal's high density and atomic number make it highly efficient in detecting gamma rays and X-rays, while the thallium activation improves the light output and energy resolution of the crystal. NaI(Tl) Scintillation Crystals are often used in gamma-ray spectrometers, PET (Positron Emission Tomography) scanners, and other radiation detection systems due to their excellent energy resolution and fast response time.
