Report Overview

A Nano Computed Tomography Scanner, often abbreviated as Nano-CT scanner, is a sophisticated imaging technology used to generate high-resolution, three-dimensional (3D) images of internal structures of various materials and objects. This advanced scanner employs X-ray sources and detectors to capture cross-sectional images, which are then reconstructed into a detailed 3D model using specialized software. The "Nano" in its name signifies its capability to achieve nanometer-level resolution, allowing for the examination of minute features and structures. This technology is particularly valuable in fields such as materials science, engineering, and biomedical research, where the analysis of microstructures and defects at a nanoscale is crucial. The Nano-CT scanner enables non-destructive testing and can be applied to a wide range of samples, from biological tissues to electronic components, providing a comprehensive understanding of their internal architecture and properties.
