Report Overview

A Nano Homogenizer is a specialized laboratory instrument designed for the efficient and precise homogenization of samples at the nanoscale level. It operates by applying high-speed mechanical forces to disrupt and homogenize various types of samples, including cells, tissues, and other biological materials. The device typically features a small probe or bead that rapidly oscillates or rotates within a sample vial, generating shear forces that break down the sample into smaller, uniform particles. This process is crucial for applications such as cell lysis, DNA/RNA extraction, and protein analysis, as it ensures that the sample is thoroughly mixed and that cellular components are released for further analysis. The Nano Homogenizer is valued for its ability to achieve high homogeneity with minimal sample loss, making it a key tool in research and diagnostic laboratories.
