Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Nano Molybdenum Disulfide competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The upstream of the nano-molybdenum disulfide industry chain mainly involves molybdenum resources and basic molybdenum chemicals, derived from molybdenum concentrate obtained from molybdenum-bearing ores (molybdenite, polymetallic copper-molybdenum ores, etc.). Downstream applications are concentrated in high-end lubricating greases and coatings. Nano molybdenum disulfide is a nanoscale two-dimensional layered material composed of molybdenum and sulfur. Due to its excellent lubricity, conductivity, and catalytic properties, it is widely used in solid lubricants, semiconductors, catalysts, and other fields. It possesses a graphite-like layered structure, facilitating interlayer sliding, thus earning it the title of "King of High-Grade Solid Lubricants." The upstream of the nano-molybdenum disulfide industry chain mainly involves molybdenum resources and basic molybdenum chemicals, derived from molybdenum concentrate obtained from molybdenum-bearing ores (molybdenite, polymetallic copper-molybdenum ores, etc.). Downstream applications are concentrated in high-end lubricating greases and coatings. Global sales volume in 2024 was approximately 23,000 tons, with an average market price of approximately US\$3,500 per ton. The industry's gross profit margin ranged from 12% to 30%. Nano-molybdenum disulfide combines the excellent layered solid lubrication properties of traditional MoS₂ with the high specific surface area and high interfacial activity of nanomaterials, making it one of the important candidate materials for current lubricating nano-additives and novel energy storage electrodes. With increasing demands for energy conservation, emission reduction, and equipment lifespan, as well as continuous increases in research investment in two-dimensional materials, nano-lubrication, and

electrocatalysis, new structures and composite systems are constantly emerging. However, at the same time, nano-molybdenum disulfide also faces several obstacles. The large-scale preparation process of high-quality, batch-stable nanosheets/nanospheres is still relatively complex, and production costs and yield rates restrict its wider application.

The global Nano Molybdenum Disulfide market size was estimated at USD 80.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Nano Molybdenum Disulfide market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
