Abstracts

The application of nanoporous silicon nitride membrane in DNA sequencing technology has many advantages, such as no need for calibration, no need for amplification, low dosage, long readable sequences, low cost, and single-molecule high-throughput detection. Therefore, it is considered to be the most competitive technology for realizing the fourth-generation rapid direct-reading DNA molecular sequencing. Its basic test principle is: the long-chain DNA molecules in the solution are driven by an electric field to pass through the nanopores on the silicon nitride membrane. Due to the blocking effect of the nanopores, the ion current will drop instantaneously. By analyzing the current drop, the biological characteristics of the perforated molecules, such as size, size and configuration, can be obtained. This is of great significance to the study of human genetic etiology, personalized medicine and many other fields.

The global Nano Porous Silicon Nitride Membrane market size was estimated at USD 215.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
