Abstracts

Nanopositioning piezo flexure stages are precision motion control devices that utilize piezoelectric actuators and flexure mechanisms to achieve highly accurate positioning at the nanometer or sub-nanometer scale. These stages are designed for applications requiring ultra-fine movement and stability, such as in microscopy, nanotechnology, semiconductor manufacturing, and optics. The piezoelectric actuators provide fast, precise motion through the expansion and contraction of piezoelectric materials when electrical voltage is applied, while the flexure design ensures frictionless, backlash-free movement with high repeatability and rigidity. Nanopositioning piezo flexure stages enable controlled, multidimensional positioning, making them critical for tasks like scanning, alignment, and manipulation at the atomic or molecular level.

The global Nanopositioning Piezo Flexure Stages market size was estimated at USD 312.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
