Report Overview

A Narrow Viewing Angle Thermopile is a type of infrared (IR) detector that is specifically designed to measure temperature changes within a limited field of view. It operates on the principle of thermopiles, which convert thermal energy into electrical energy. This product features a narrow viewing angle, which allows for precise temperature measurement in a focused area, making it ideal for applications where accuracy and specificity are crucial. The thermopile consists of a series of thermocouples connected in series, which generate a voltage proportional to the temperature difference between the hot and cold junctions. This voltage can then be processed and analyzed to determine the temperature of the object or environment being monitored. The narrow viewing angle thermopile is commonly used in industrial processes, medical imaging, and scientific research where targeted temperature measurements are required.
