Report Overview

Poultry feed antioxidants are specialized additives incorporated into animal feed to prevent oxidative degradation of fats, vitamins, and other essential nutrients, thereby enhancing the shelf life and nutritional quality of the feed. These antioxidants work by inhibiting lipid peroxidation, which can otherwise lead to rancidity, reduced palatability, and diminished nutritional value, ultimately affecting poultry health and productivity. Common synthetic antioxidants include ethoxyquin, BHA (butylated hydroxyanisole), and BHT (butylated hydroxytoluene), while natural alternatives such as tocopherols (vitamin E) and plant-derived polyphenols are gaining traction due to increasing consumer demand for clean-label and organic feed solutions. The inclusion of antioxidants in poultry feed is critical not only for maintaining feed stability but also for supporting immune function, growth performance, and meat quality in poultry, making them an indispensable component in modern animal nutrition.
