Report Overview

Near-Space Vehicles refer to a category of aerial platforms designed to operate in the near-space environment, which is the region of Earth's atmosphere above conventional aviation but below space. These vehicles are engineered to fly at high altitudes, typically between 20 to 100 kilometers above the Earth's surface, where they can take advantage of the thin atmosphere to achieve extended flight durations and cover vast areas. Near-Space Vehicles can be powered by various means, including solar energy, and are often equipped with advanced communication, surveillance, or scientific instruments. They are used for a wide range of applications, such as weather monitoring, communication relays, Earth observation, and military surveillance, providing a cost-effective alternative to satellites for certain tasks. The design and operation of these vehicles require sophisticated engineering to withstand the unique challenges of the near-space environment, such as low temperatures, high radiation levels, and minimal atmospheric pressure.
