Abstracts

Needle-free injection is an injection method that does not have a traditional capillary needle. It does not need to be pierced into the body through a needle. Instead, the needle-free injection pusher generates a certain pressure through a mechanically stable annular compression spring system, and pushes it under pressure. The medicinal solution is diffused into the patient's subcutaneous tissue. Therefore, the pain and fear of needle sticks will be reduced to a certain extent.

The global Needle Free Injection Drug Delivery System market size was estimated at USD 1528.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.80% during the forecast period.
