Abstracts

A negative pressure diaphragm air pump is an air pump that uses a diaphragm structure to generate negative pressure. Unlike positive pressure air pumps, negative pressure air pumps are designed to create a negative pressure area through the movement of the diaphragm, thereby attracting gas or liquid into the pump. This type of air pump is typically used in applications that require the extraction of air or other gases, such as laboratory equipment, medical equipment, analytical instruments, etc. Their diaphragm structure allows them to effectively isolate the medium between suction and discharge, ensuring that the pumped gas or liquid does not come into contact with moving parts within the pump. Advantages of negative pressure diaphragm air pumps include low noise, low vibration, and easy maintenance and cleaning. This makes them widely used in some occasions that have high environmental requirements and require stable suction.

The global Negative Pressure Diaphragm Air Pump market size was estimated at USD 78.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
