Abstracts

Neutron radiography detection technology is based on the principle of interaction between neutrons and matter. Since neutrons are uncharged, when penetrating objects, they do not interact with the electrons outside the nucleus of atoms through the Coulomb force, so they can easily pass through the electron layer and directly hit the nucleus to cause nuclear reactions, such as absorption reactions, fission reactions, or scattering reactions. The stronger the nuclear reaction, the more the neutron intensity is weakened, so that the intensity of the penetrating neutron beam is weakened accordingly.

The global Neutron Radiography Detection Technology market size was estimated at USD 28.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
