## Abstracts

Newborn metabolic screening, also known as newborn screening or heel-stick testing, is a public health program aimed at identifying certain metabolic, genetic, and congenital disorders in newborns shortly after birth. The screening involves collecting a small blood sample, typically obtained by pricking the newborn's heel, and testing it for the presence of specific markers associated with these disorders. Early detection allows for prompt intervention and treatment, often preventing or minimizing the development of serious health issues. Continuous expansion of newborn screening panels to include additional metabolic, genetic, and congenital disorders. Advances in genetic testing technologies may contribute to the identification of new conditions.
