Report Overview

Nickel powder for multi-layer ceramic capacitors is a high-purity, fine-grained metallic powder used as a key component in the manufacturing of multi-layer ceramic capacitors (MLCCs). This product is characterized by its uniform particle size, high purity, and excellent flowability, which are essential for achieving optimal performance in capacitors. The nickel powder is mixed with other materials, such as ceramic powders and organic binders, to form a paste that is then used to create the internal layers of the capacitor. The fine particle size of the nickel powder allows for a high dielectric constant, which is crucial for the capacitor's ability to store electrical energy. Additionally, the high purity of the nickel powder ensures minimal impurities, which can affect the reliability and stability of the capacitor over time. The nickel powder's role in MLCCs is to provide a conductive path for the flow of electric current, contributing to the overall performance and efficiency of the electronic component.
