Abstracts

Nitinol Continuous Compression Implants are medical devices made from a nickel-titanium alloy (Nitinol), known for its superelasticity and shape memory properties. These implants provide continuous, dynamic compression across bone fractures or fusions, promoting faster and more reliable healing. The material's ability to return to a pre-set shape after deformation ensures constant pressure is applied to the affected area, optimizing stabilization and bone healing. Nitinol implants are commonly used in orthopedic surgeries, especially for small bones in the hands, feet, and spine.

The global Nitinol Continuous Compression Implants market size was estimated at USD 285.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
