Report Overview

Nitisinone, also known as Orfadin, is a pharmaceutical drug primarily used for the treatment of hereditary tyrosinemia type 1 (HT-1), a rare genetic metabolic disorder characterized by the accumulation of toxic metabolites in the body. This condition can lead to severe liver and kidney damage if left untreated. Nitisinone functions by inhibiting the enzyme 4-hydroxyphenylpyruvate dioxygenase (HPPD), which is involved in the metabolic pathway of tyrosine. By inhibiting HPPD, nitisinone reduces the production of harmful metabolites, thereby alleviating the symptoms and complications associated with HT-1. The drug is typically administered orally and is considered a standard treatment option for managing the disease in patients of all ages. Nitisinone has been shown to improve liver function, reduce the risk of liver cancer, and enhance the quality of life for individuals affected by HT-1.
