Abstracts

The nitrogen adsorption pore size analyzer is an instrument used to evaluate the pore structure and pore size distribution of materials. It is based on the principle of adsorption and determines the characteristics of pore structure by measuring the amount of nitrogen adsorption on the material. Nitrogen adsorption pore size analyzer usually uses low-temperature adsorption method, which is to conduct experiments at liquid nitrogen temperature. First, the adsorption Active site on the sample surface will adsorb nitrogen molecules, and then gradually force the nitrogen molecules out of the pores, and measure the relationship between the adsorption amount and the corresponding pressure or concentration. According to the change of adsorption Contour line#Temperature and related subjects and adsorption capacity, the parameters such as pore size, pore volume and pore distribution can be calculated. By using a nitrogen adsorption pore size analyzer, important pore characteristics such as pore size distribution, pore volume, and specific surface area of materials can be obtained. This is very important for research and application in many fields, such as materials science, catalyst research, adsorption material evaluation, and pore filler performance analysis. It should be noted that the nitrogen adsorption pore size analyzer is suitable for pore analysis in the range of medium to microporous diameters, typically within the pore size range of 2 nm to 500 nm. For materials with larger pore sizes, other methods such as gas adsorption and mercury intrusion may be required for pore structure analysis.

The global Nitrogen Adsorption Pore Size Analyzer market size was estimated at USD 185.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
