Report Overview

Non-absorbable suture material refers to a type of surgical suture that does not get absorbed by the body over time. These sutures are typically made from materials such as polyester, polypropylene, or silk, which maintain their strength and integrity for an extended period post-surgery. They are commonly used in situations where long-term support is required, such as in hernia repairs, tendon repairs, or orthopedic surgeries. Non-absorbable sutures provide a stable and durable structure that resists degradation by the body's natural processes, ensuring the integrity of the surgical repair. They are usually removed after the healing process is complete, which can range from a few weeks to several months, depending on the specific surgical procedure and the patient's individual healing rate.

In 2024, the global Non-absorbable Suture Material market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
