Abstracts

A Non-contact Capacitive Air Gap Sensor is a device used to measure the distance or gap between two surfaces without physical contact. It operates on the principle of capacitance, where changes in the gap cause variations in the electrical capacitance between a sensing electrode and the target surface. The sensor detects these changes to accurately determine the air gap. This type of sensor is commonly used in applications where precision measurement is crucial, such as in manufacturing, quality control, and engineering, particularly in situations where direct contact with the surface could cause damage or contamination.

The global Non Contact Capacitive Air Gap Sensor market size was estimated at USD 125.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
