Abstracts

The non-contact metal film thickness measuring instrument is an instrument used to measure the thickness of metal films. It uses a non-contact measurement method to measure the metal thin film through optical or other physical methods without direct contact with the metal surface. The working principle of the non-contact metal film thickness measuring instrument is usually to measure the thickness of the metal film by using the reflection, scattering or transmission characteristics of light. By measuring the characteristic change of light, the thickness of the metal thin film can be calculated. The non-contact metal film thickness measuring instrument has the advantages of fast measurement speed, high precision and easy operation. It is widely used in the fields of measuring and controlling the thickness of metal thin films in semiconductor, optoelectronics, coating and other industries. The method of using the non-contact metal film thickness measuring instrument generally includes placing the metal sample to be tested on the measuring platform, adjusting the parameters of the instrument, and then triggering the measurement. The instrument will automatically complete the measurement and output the result. Some advanced instruments can also provide data analysis and report generation functions.

The global Non Contact Metal Film Thickness Measuring Instrument market size was estimated at USD 185.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
