Report Overview

A non-digital breath ketone analyzer is a device used to measure the concentration of ketone bodies (such as acetone) in the breath, often used to monitor blood ketone levels in people with diabetes. The device works similarly to a roadside alcohol test, estimating ketone levels in the blood by analyzing the acetone concentration in the breath. The advantage of this technology is that it is non-invasive, less harmful to patients and easier to operate than traditional blood testing methods. In addition, the non-digital breath ketone analyzer is based on a highly sensitive sensing technology that can accurately measure ketone body concentration in breath without being affected by alcohol or other gases. This device is particularly useful for managing the risk of ketoacidosis in people with Type I diabetes, as it can help promptly detect and reduce the risk of serious medical emergencies.
