### Report Overview

Non-forest Biomass Pellets are a type of biomass fuel derived from organic materials that originate from sources other than forests. These pellets are typically made from agricultural residues, such as straw, corn stalks, or other plant-based waste products, which are collected, dried, and compressed into a uniform, cylindrical shape. They are used as a renewable energy source for heating and power generation, offering a sustainable alternative to fossil fuels. Non-forest biomass pellets are valued for their low carbon footprint, as they release only the amount of carbon dioxide that was absorbed by the plants during their growth, making them a carbon-neutral energy source. Additionally, they contribute to waste management by utilizing materials that would otherwise be discarded, thereby reducing landfill waste and promoting a circular economy.
