Report Overview

A Non-Locking Compression Plate is a type of orthopedic surgical implant designed for the fixation and stabilization of bones during the healing process. This device is made from biocompatible materials such as stainless steel, titanium, or other alloys that are compatible with human tissues. The plate features a series of evenly spaced holes or slots along its length, which allow for the insertion of screws to secure the plate to the bone. Unlike locking plates, non-locking compression plates rely on the friction between the plate and bone to maintain stability, and they often require the use of compression screws to apply force and promote bone healing. These plates are commonly used in various orthopedic procedures, including fracture repair, osteotomy, and arthrodesis, and are selected based on the specific anatomical location and the nature of the bone injury or surgical intervention.
