Report Overview

Non-metallic expansion joints, also known as flexible expansion joints or flexible connectors, are engineered components designed to absorb thermal expansion and contraction in piping systems while accommodating misalignment and vibration. These joints are typically made from non-metallic materials such as elastomers, fabric, or other flexible materials that can withstand temperature changes, corrosion, and various environmental conditions. They are used in a wide range of industries, including chemical processing, power generation, and water treatment, to provide a reliable and flexible connection between pipe sections, ensuring the integrity and longevity of the piping system. Non-metallic expansion joints offer advantages such as resistance to corrosion, ease of installation, and the ability to handle a broad range of temperatures and pressures, making them a preferred choice in many applications where metal expansion joints may not be suitable.
