### Report Overview

Non-network connected non-IC card power smart meters are advanced metering devices designed to measure and record electricity consumption without relying on network connectivity or IC card technology. These meters typically feature digital displays, real-time energy monitoring, and data storage capabilities, but they lack remote communication functions, requiring manual data collection or on-site reading. They are often used in scenarios where network infrastructure is unavailable, cost-prohibitive, or where data security concerns limit the adoption of connected solutions. The absence of IC card functionality differentiates them from prepaid meter models, making them suitable for postpaid billing systems. Key features may include tamper detection, load control, and local data interfaces for periodic manual downloads, positioning them as a middle ground between traditional electromechanical meters and fully networked smart grid solutions. Their design prioritizes reliability, accuracy, and longevity in offline environments while maintaining some degree of smart functionality for improved energy management.
