Abstracts

Non-standard RAID mode hard disk array refers to RAID mode hard disk array other than standard RAID mode hard disk array (such as RAID 0, RAID 1, RAID 5, etc.). These standard modes can achieve data redundancy, performance improvement or a combination of the two through specific data distribution and redundancy algorithms, thus forming a non-standard RAID mode hard disk array. These non-standard modes may be generated based on specific needs, hardware limitations or innovative designs. They may combine some features of standard RAID modes, but at the same time they are different. Non-standard RAID mode hard disk arrays usually include: proprietary or vendor-specific standard RAID modes (such as RAID 7, a non-standard RAID level based on RAID 3 and RAID 4 technology and requiring dedicated hardware. This RAID level is owned and trademarked by the now defunct Storage Computer Company; Adaptive RAID, which allows the RAID controller to find out how to store parity codes on the disk by itself, and can choose between RAID 3 and RAID 5, depending on which RAID set is suitable for the type of data to be written to the disk) and nested or combined RAID modes.

The global Non Standard Raid Mode Hard Disk Array market size was estimated at USD 3850.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
