Abstracts

Non stick ceramic coatings are a novel coating material that combines inorganic and organic substances, and have been widely used in various industrial fields in recent years. Its unique advantages are not only reflected in its excellent physical and chemical properties, but also in its adaptability to various complex environments and environmental friendliness. Non stick ceramic coatings have excellent wear resistance and scratch resistance. Due to the high hardness of ceramic materials themselves, usually between six and eight, the coatings made from them have excellent wear resistance. This means that the coating is not easily worn or scratched during long-term use, thus maintaining a long-lasting good appearance and performance. In addition, the hardness of ceramic non stick coatings also enables them to effectively resist various mechanical impacts, ensuring that the coating remains stable in complex working environments. Non stick ceramic coatings have excellent high temperature resistance. This type of coating can typically withstand high temperatures of up to 450 degrees Celsius without deformation or damage. This has led to the widespread use of ceramic non stick coatings in high-temperature cooking or baking equipment such as cookware and kitchenware. In high temperature environments, ceramic non stick coatings can maintain a stable coating structure, effectively preventing food or grease from adhering to equipment surfaces, improving cooking efficiency, and reducing cleaning difficulty.

The global Non Stick Ceramic Coating market size was estimated at USD 866.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
