Report Overview

Normal putty powder is a commonly used construction material composed primarily of fillers (such as calcium carbonate or talc powder), binders (typically cement or gypsum), and additives (including cellulose ether, redispersible polymer powder, and other modifiers) that enhance workability, adhesion, and durability. It is widely applied in interior and exterior wall surfaces to smooth substrates, fill cracks, and prepare surfaces for painting or decorative finishes. Available in both cement-based and gypsum-based formulations, normal putty powder caters to different environmental conditions and substrate requirements, with cement-based variants being more moisture-resistant and suitable for exterior applications, while gypsum-based putty is favored for its quick drying and smooth finish in interior settings. The product's performance is often measured by parameters such as bonding strength, flexibility, water resistance, and sandability, making it a critical component in construction quality and finishing efficiency.
