Report Overview

A Nuclear Heat Exchanger is a critical component in nuclear power plants, designed to efficiently transfer heat from the nuclear reactor's primary coolant to a secondary coolant system. This process is essential for generating steam, which drives turbines to produce electricity. The heat exchanger operates within a closed-loop system, ensuring that radioactive materials remain contained and do not mix with the secondary loop. It is typically constructed from robust materials capable of withstanding high pressures and temperatures while maintaining structural integrity in the face of potential radiation exposure. The design and operation of a nuclear heat exchanger must adhere to stringent safety regulations to prevent leaks and ensure the safe and efficient transfer of heat energy.
