Abstracts

A nuclear power plant main pipeline typically refers to the primary piping system in a nuclear power station that transports high-temperature, high-pressure coolant (such as water or gas). It is a critical component of the cooling system, responsible for transferring the heat generated by the reactor to steam generators or other heat exchange equipment to facilitate energy conversion. The growth in global energy demand, particularly for clean energy, has driven the adoption of nuclear energy as a low-carbon solution, which in turn promotes the construction of new nuclear power plants. These new plants require substantial amounts of main pipeline systems, driving market demand. At the same time, government energy policies, such as tax incentives and subsidies, help facilitate the advancement of nuclear projects. Additionally, the long construction and operational cycles of nuclear power plants mean that pipeline demand will remain steady throughout the plant's lifespan, including both the pipelines needed for new plants and those required for maintenance and upgrades of existing plants. Therefore, energy demand and policies, along with the construction and operational cycles of nuclear power plants, are closely interconnected and collectively drive the development of the nuclear power plant main pipeline market.

The global Nuclear Power Main Pipeline market size was estimated at USD 900.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
