## Abstracts

Nuclear receptors (NRs) are ligand-activated transcription factors that regulate gene expression and play a key role in endocrine signaling. They bind to ligands (usually small lipophilic molecules such as steroids, vitamins, and fatty acid derivatives) and activate transcription of the genome, play different roles in cell differentiation, development, proliferation, and metabolism, and are associated with a variety of diseases, such as cancer, cardiovascular disease, inflammation, and reproductive abnormalities. This makes it one of the most important targets for therapeutic drug development.
