Report Overview

Nylon Tyre Cord Fabrics (NTCF) are engineered textiles specifically designed for use in the manufacturing of tires. These fabrics are made from nylon fibers that are woven or knitted into a strong, durable fabric that serves as a reinforcing layer within the tire structure. The primary function of NTCF is to provide tensile strength and stability to the tire, ensuring it can withstand the forces exerted during driving. The fabric is characterized by its high resistance to fatigue, excellent adhesion to rubber, and resistance to heat and chemicals. NTCF is typically used in radial tires, where it forms the tire's bead, sidewall, and body plies. The bead is the edge of the tire that seats on the wheel rim, while the sidewall and body plies contribute to the tire's overall strength and shape. The use of NTCF in tires enhances their performance, durability, and safety, making it a critical component in the tire manufacturing process.
