Report Overview

Beta-2 Adrenoceptor Agonists, also known as beta-2 agonists or beta-2 stimulants, are a class of medications that primarily act on the beta-2 adrenergic receptors in the body. These receptors are predominantly found in the smooth muscles of the lungs, heart, and blood vessels. Beta-2 agonists work by stimulating these receptors, leading to relaxation of the bronchial muscles, increased heart rate, and vasodilation. They are primarily used in the treatment of respiratory conditions such as asthma and chronic obstructive pulmonary disease (COPD), as well as certain cardiac conditions. The product name refers to the specific class of drugs that target the beta-2 adrenoceptors, and the definition encompasses their mechanism of action, therapeutic applications, and the receptors they interact with.
