### Report Overview

Octyl 4-methoxycinnamate (OMC), also known as octinoxate, is an organic compound widely used as a chemical UV filter in sunscreens, cosmetics, and personal care products. It absorbs UVB radiation (290-320 nm), protecting the skin from sun damage, and is favored for its photostability and compatibility with other sunscreen ingredients. The global market for OMC is driven by rising consumer awareness of skin protection, increasing demand for sun care products, and stringent regulations promoting UV filters in cosmetics. However, concerns over its potential endocrine-disrupting effects and environmental impact, particularly on marine ecosystems, have led to regulatory restrictions in regions like Hawaii and Palau, prompting manufacturers to explore alternative ingredients. Despite these challenges, OMC remains a key component in sunscreen formulations, especially in regions with high UV exposure, with Asia-Pacific and North America being dominant markets due to high sunscreen adoption rates. Innovation in stabilizing OMC in formulations and growing demand for multifunctional skincare products further support its market growth.
