## Abstracts

Off-center load cells, also known as off-center or eccentric load cells, are specialized sensors designed to measure force or load, but with a deliberate displacement of the load from the central axis. In traditional load cells, the load is applied directly to the center of the cell, ensuring that the force is applied uniformly across the sensor. However, off-center load cells are intentionally designed to measure loads applied at a specific distance from the central point. Advancements in materials science may lead to the development of load cells using new alloys, composites, or coatings, enhancing durability, corrosion resistance, and overall performance in various environments.

The global Off Center Load Cells market size was estimated at USD 79.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
