Report Overview

An Oil Immersed Fixed Shunt Reactor is a type of electrical equipment designed to provide reactive power compensation in power systems. It is a fixed-value shunt reactor that is immersed in insulating oil to ensure effective cooling and protection against environmental factors. The reactor consists of a coil or winding of conductive material, typically copper or aluminum, which is housed within a sealed tank filled with insulating oil. This oil serves multiple purposes, including heat dissipation, moisture prevention, and protection against physical damage. The fixed shunt reactor is used to maintain voltage stability and power factor correction in electrical systems by providing a path for reactive power flow, thus helping to balance the system's reactive power and improve overall efficiency. It is commonly employed in substations and industrial facilities where stable and efficient power distribution is critical.
