Report Overview

An Oil Mist Recovery Machine is an industrial equipment designed to capture and remove oil mist particles from the air in various manufacturing environments, such as machine shops, foundries, and metalworking facilities. This machine operates by drawing in air containing oil mist, which is then passed through a filtration system that separates the oil particles from the air. The filtration process typically involves a combination of mechanical separation, coalescing, and/or electrostatic precipitation techniques. The recovered oil is either collected for reuse or disposal, while the cleaned air is released back into the environment. The primary purpose of an Oil Mist Recovery Machine is to maintain a clean and safe working environment, comply with environmental regulations, and conserve resources by recycling the captured oil.
