### Report Overview

An Oil Spill Boom, also known as an oil containment boom or oil containment barrier, is a floating device designed to prevent the spread of oil spills in water bodies such as oceans, rivers, and lakes. It is typically made from flexible materials like rubber, plastic, or fabric, and is equipped with buoyant elements to keep it afloat. The boom is strategically placed around the perimeter of an oil spill to contain the oil within a specific area, preventing it from spreading further and causing more extensive environmental damage. It can be used in conjunction with other oil spill response equipment, such as skimmers and absorbent materials, to effectively manage and clean up oil spills.
