Report Overview

Oilseed Extraction is a process employed in the agricultural and food industries to extract valuable oils from oil-bearing seeds. This process involves the mechanical or chemical separation of oil from seeds such as soybeans, canola, sunflower, and others. The extraction methods can be categorized into mechanical pressing, solvent extraction, and pre-press solvent extraction. Mechanical pressing involves the physical crushing and pressing of seeds to release the oil, while solvent extraction uses a solvent, typically hexane, to dissolve the oil from the seeds. Pre-press solvent extraction combines both mechanical pressing and solvent extraction to optimize oil yield. The extracted oil is then further refined, bleached, and deodorized to meet quality standards for consumption or industrial use. The by-products, such as meal or cake, are also valuable and are used as animal feed or in the production of biofuels.
