### Report Overview

Omalizumab Injection is a biologic medication primarily used for the treatment of moderate to severe allergic asthma and chronic idiopathic urticaria (hives) in patients who do not respond well to conventional treatments. It is a monoclonal antibody that works by targeting and binding to Immunoglobulin E (IgE), a protein involved in allergic reactions. By reducing the levels of free IgE in the body, Omalizumab Injection helps to minimize the activation of immune cells that contribute to allergic symptoms. This medication is administered subcutaneously (under the skin) and is typically prescribed for individuals with a history of severe allergic reactions or those who have not found relief with standard asthma medications. It is important to note that Omalizumab Injection is not a rescue medication for acute asthma attacks and should be used in conjunction with a comprehensive asthma management plan.
